Re: Application for Software Engineer I role at AMERICAN EXPRESS

Dear Hiring Manager,

I am writing to apply for the Software Engineer I role at AMERICAN EXPRESS. I recently completed my B.Tech in Computer Science and Engineering (Cyber Security) from G. H. Rasoni College of Engineering with a 9.23 CGPA, and I bring backend engineering experience from three software development internships, a self-built blockchain platform, and a published research paper. I'd welcome the opportunity to bring that mix of production experience and independent project depth to your engineering team.

Most recently, as a Software Developer Intern at Capgemini, I built and tested backend services in Java and Python on AWS (EC2, S3), following clean architecture principles to keep the codebase maintainable and production-ready. At ANORG Technologies, I worked across three concurrent projects integrating REST APIs and collaborating through Git-based PR workflows, maintaining a 100% daily reporting cadence in a fully remote team. Earlier, at GHRCE's Center of Excellence for AI/ML, I built an IoT-based smart medicine dispenser that improved scheduling efficiency by 66% and cut Android response times by 40% through targeted performance profiling.

Outside of internships, I designed and built DECAID, a decentralized academic credential verification platform using Ethereum smart contracts, IPFS-based storage, and Zero-Knowledge Proofs for privacy-preserving verification, on a React, Node.js, FastAPI, and PostgreSQL stack supporting concurrent multi-institution credential issuance. I've also shipped a Kotlin/Jetpack Compose BMI tracking app built on MVVM architecture, and hold certifications in AWS Cloud Practitioner Essentials, Oracle Cloud Infrastructure Foundations, and FastAPI. This work was recently recognized with a published paper at the Microsoft CMT International Conference 2025.

I'm a fast learner who enjoys picking up new tools and frameworks quickly, a habit reinforced by solving 350+ algorithmic problems on LeetCode and GeeksforGeeks. I'd welcome the chance to discuss how my backend engineering, cloud infrastructure, and security-minded system design background could contribute to AMERICAN EXPRESS's team. Thank you for your time and consideration.

Sincerely,

Chetan Awari
